

Buy-and-Hold vs. InTheMoney

A \$500 Three-Engine Portfolio

Seventeen positions, three engines, four rules. Built to sit untouched for years, get checked for fifteen minutes a quarter, and have a real shot at matching or beating an actively traded, 94%-AI portfolio over a full cycle.

39%

AI COMPUTE &
PLATFORMS

\$195

36%

GLP-1 / OBESITY
PIPELINE

\$180

15%

POWER & GRID

\$75

Plus 5% in a legacy S&P 500 fund and 5% in T-bills as the rebalancing reservoir. Entered with buys only, on top of an existing 12-position account.

The bet in one sentence. Three engines instead of one: AI compute, the GLP-1 franchise, and the electricity AI runs on, rebalanced mechanically inside wide bands. It should compound at least as fast as a single concentrated AI bet, keeps working when AI capex pauses, and needs almost none of the trading.

Prepared for a \$500 fractional-share brokerage account. Data as of the September 15 to 16, 2026 market close unless noted. Every figure is sourced in the appendix; several are from news excerpts rather than primary filings and are flagged as approximate. This is an educational research document, not individualized investment advice. Positions can lose money; single-name biotech can go to zero.

1. Executive summary

What InTheMoney holds. The "Actively Managed" Autopilot portfolio (screenshot, Sept 16, 2026) is 14 names: MU 12%, NVDA 12%, AMD 12%, TSM 10%, MSFT 9%, GOOGL 9%, ASML 6%, AVGO 6%, META 6%, LRCX 5%, AMZN 4%, FRO 4%, VLO 3%, AEM 3%. That is roughly 94% AI semiconductors and megacap platforms, 7% tankers, refining and gold, and zero healthcare. It has had a monster 2026: Micron is up roughly 256% year to date, AMD about 135%, Valero about 141%, Lam about 55%, ASML about 48%.

What this portfolio does instead. It keeps most of the AI exposure but gets it through the toll collectors (NVDA, TSM, AVGO) plus AMD and Microsoft, rather than 36% in three cyclical chip names at peak margins. It adds a second engine, the GLP-1 obesity franchise, which is growing 40 to 50% a year and is priced off drug volumes, not hyperscaler capex. It adds a third, the power and grid equipment every data center in those capex numbers depends on, which he does not own at all. And it keeps 5% in Treasury bills so a bad quarter in any engine is something you buy into, not something you endure.

Portfolio as entered (grey = legacy VOO 5% + T-bill reservoir 5%)

InTheMoney "Actively Managed" by theme (tankers, refining, gold = 7%; percentages in the app sum to 101 from rounding)

Why it can win over the long run

- Two uncorrelated growth engines.** GLP-1 revenue depends on prescriptions and pricing, not on whether Microsoft raises capex again. When one engine stalls, the other keeps compounding.
- Less blow-up risk in the same theme.** His book has 36% in MU, AMD and NVDA after a year in which memory margins hit 85%. Memory is the most cyclical corner of semis. Here NVDA is 11%, AMD 7%, and memory is not held directly at all.
- Bands sell strength and buy weakness automatically.** An active manager has to be right twice, on the exit and on the re-entry. A band rule is right on average, and a 5% T-bill reservoir funds it without selling a winner.
- A chokepoint he does not own.** Every data center in the capex numbers needs electricity. Gas turbines and transformers are backlogged for years and nuclear output is being contracted a decade out. Vertiv, GE Vernova and Constellation collect the toll on that bottleneck; his book has zero exposure to it.
- Lower cost and lower taxes.** No subscription, no adviser layer, and a handful of trades a year instead of dozens.

Honest caveat. If AI keeps melting up the way it did in the first eight months of 2026, a 94% AI book beats this one. The claim here is better risk-adjusted return over a full cycle that includes the down year, not out-running a concentrated bet during a bubble. The macro backdrop (a Fed that just hiked, a 10-year Treasury above 5% for the first time since 2007, and a widely discussed "late-stage bubble" debate) is exactly the environment in which a second engine earns its keep. This version deliberately carries no gold or energy ballast beyond a legacy 5% in VOO: it is built to race, and when AI corrects it will fall harder than a ballasted book, because the power names fall with the chips.

2. The portfolio as entered: 17 positions, no sells

The account already held twelve positions worth \$259.63 that express most of this thesis. Rather than sell five of them to rebuild, the \$241 deposit goes entirely to buys, and the four names outside the plan (VOO, HIMS, WST, AMZN) are simply never added to again. They shrink into rounding errors as deposits arrive; selling them is optional, never required. That is the buy-and-hold answer, and it is also the one with zero tax events.

The twelve orders (dollar-amount fractional buys at tomorrow's open): LLY \$42 · NVO \$35 · GEV \$25 · CEG \$25 · SGOV \$25 · AMGN \$20 · NVDA \$15 · TSM \$15 · VRT \$15 · AVGO \$12 · MSFT \$11 · GPCR \$1. Total \$241.00. Nothing sold.

TICKER	ROLE	WEIGHT	TARGET	ADD FIRST BELOW	TRIM ABOVE	BACK TO
ENGINE ONE · AI COMPUTE AND PLATFORMS · 39% · \$195						
NVDA	Accelerator leader; supply-constrained through FY28	10.8%	11%	5.5%	22%	16.5%
TSM	Leading-edge foundry, ~72% share	7.7%	8%	4%	16%	12%
AMD	Direct chip bet, kept rather than swapped for an ETF	6.7%	7%	3.5%	14%	10.5%
MSFT	Azure +43%; steadiest cash flow	5.4%	5%	2.5%	10%	7.5%
AVGO	Custom AI silicon and networking	5.0%	5%	2.5%	10%	7.5%
AMZN	Legacy. AWS exposure; never add	3.2%	—	never	6%	3%
ENGINE TWO · GLP-1 / OBESITY · 36% · \$180						
LLY	Category leader; absorbs the weight PFE and WST had in the first draft	15.7%	16%	8%	32%	24%
NVO	Contrarian second source; oral Wegovy, amycrin	7.0%	7%	3.5%	14%	10.5%
AMGN	MariTide monthly dosing inside a dividend payer	4.0%	4%	2%	8%	6%
GPCR	Speculative oral GLP-1 in Phase 3; never add	2.0%	2%	never	6%	3%
HIMS	Legacy. Distributor, not developer; never add	3.7%	—	never	8%	4%
WST	Legacy. Pen components at ~30x; never add	3.6%	—	never	8%	4%
ENGINE THREE · POWER AND GRID · 15% · \$75						
VRT	Data-center power distribution and liquid cooling	5.1%	5%	2.5%	10%	7.5%
GEV	Gas turbines, transformers, switchgear. Chart-check before buying	5.0%	5%	2.5%	10%	7.5%

TICKER	ROLE	WEIGHT	TARGET	ADD FIRST BELOW	TRIM ABOVE	BACK TO
CEG	Largest US nuclear fleet, hyperscaler contracts. Chart-check before buying	5.0%	5%	2.5%	10%	7.5%
OTHER · 10% · \$51						
V00	Legacy S&P 500 fund; harmless ballast; never add	5.2%	—	never	10%	7.5%
SGOV	0-3 month T-bills; the rebalancing reservoir	5.0%	5%	refill at 3%	—	5%
Total (\$500.63 after the deposit)		100%				

Bands are per position: core names have an add-first level at half their target and a trim level at twice it, trimmed back to 1.5x. Legacy and speculative names have no add level and are trimmed if they double. These, plus one AI-group ceiling, are the only things to check each quarter (section 7). The workbook's Quarterly check tab does the arithmetic. A clean-sheet 14-position version (SMH for AMD, GOOGL for AMZN, VKTX added, legacy names sold) is in the repository history for anyone starting from cash.

3. Side by side with InTheMoney

InTheMoney "Actively Managed"

TICKER	WEIGHT	2026 YTD*

MSFT	9%	+3%
GOOGL	9%	+10%
ASML	6%	+48%
AVGO	6%	-2%
META	6%	+1%
LRCX	5%	+55%
AMZN	4%	+7 to 11%
FRO	4%	n/a (+87% 12-mo)
VLO	3%	+141%
AEM	3%	+8%

*Approximate, from Sept 15 closes vs. Dec 31, 2025 closes reported in news excerpts. Weights are the app's rounded figures (sum 101%).

What is the same, what is different

Overlap. Six of his names are held directly here (NVDA, TSM, AMD, AVGO, MSFT, AMZN) at 39% combined, versus 63% of his book in the same six. His top three are NVDA, MU and AMD at 12% each; here they are 11%, 0% and 7%.

What he has that this does not. Micron, ASML, Lam and Meta; tanker and refiner equities; a gold miner. Micron and AMD are the two biggest sources of his 2026 return and the two most cyclical names in the book; this portfolio holds AMD at half his weight and Micron not at all.

What this has that he does not. Any healthcare at all: 35% in a franchise whose leader is growing revenue 48% and whose laggard trades at 12x trailing earnings. Fifteen percent in the power and grid chokepoint that every one of his data-center names depends on. And a small Treasury sleeve to buy dips with.

Behavioral difference. He can rotate out of a sector the week it breaks. This portfolio cannot, by design. It compensates with two things: wide bands that force it to sell winners into strength, and written kill switches (section 7) that are decided in advance, not in a panic.

The fair comparison. Judge both on a rolling three-year basis, total return, including the year AI has a drawdown. On a one-year basis in a semiconductor melt-up, he should win and it proves little either way.

4. Macro backdrop: the Fed is hiking again

3.75-4.00%

FED FUNDS, +25
BP ON SEPT 16

3.4% / 2.4%

AUG CPI HEADLINE
/ CORE, Y/Y

~5.0%

10-YR TREASURY,
HIGHEST SINCE
2007

~19x

S&P 500 FORWARD
P/E

The Fed. On September 16 the FOMC raised the target range by 25 basis points to 3.75 to 4.00%, unanimously, the first hike since July 2023. Chair Warsh said inflation has been "too high, for too long" and that the Committee "must be confident that underlying inflation is moving to our objective clearly and at sufficient speed." Sixteen of eighteen participants pencilled in at least one more hike; the median path is one more in 2026 and one in 2027 before any cuts. Stocks were up into the decision and sold off during the press conference; the 10-year closed around 5.01%.

Inflation. August CPI rose 0.4% on the month and 3.4% on the year. Core was 0.3% and 2.4%, the smallest annual core print since 2021, so the problem is energy, not broad-based: gasoline was up 3.9% in August and 27% year over year and accounted for more than a third of the monthly increase. Shelter is easing (3.0% from 3.2%). Producer prices were up 5.4% year over year with energy responsible for three quarters of the August rise. Energy inflation is also what is repricing electricity, which is the tailwind behind the Constellation position.

Valuation and the bubble debate. The S&P 500 sits near 7,550, up about 12% in 2026, with a forward P/E that has compressed from 22.5x in January to about 19x because earnings are growing 30%+. Morgan Stanley's target is 8,000 by year end and 8,300 by mid-2027, explicitly "an earnings story, not a multiple expansion one." Capital Economics, on the other side, screened eight bubble indicators and called the market "consistent with a late-stage bubble," forecasting 8,250 by year end and then a 21% fall in 2027, citing the 1999 to 2000 template of a Fed hiking into an equity mania. Both camps agree on one thing: the next twelve months' return depends on AI earnings delivering, not on multiples.

What this means for the portfolio. Rising real rates compress long-duration growth multiples and raise the cost of capital for pre-revenue biotech, which is why the speculative biotech sleeve is capped at 4% combined and the profitable, cash-rich leaders (NVDA, TSM, LLY) get the weight. Higher short rates also make the SGOV reservoir pay for itself while it waits.

September's warning shot. On September 12, Anthropic's CEO published "We Must Pace the Frontier," calling for a slowdown in frontier model development; OpenAI's CEO agreed within hours and shelved a 2026 IPO. Chips fell on September 14 (MU -5%, AMD -5 to -6%, AVGO -3%, NVDA -2%). Nothing in that changes 2026 to 2027 capex, but it is the first time the industry itself has argued for a slower pace, and it is a reminder that the AI sleeve needs a partner.

5. Engine one: AI compute and its supply chain (39%)

The demand is contracted, not hoped for. The four largest hyperscalers guided 2026 capital spending to roughly \$725 to 765 billion, up about 77% from 2025, and consensus for 2027 is close to \$1 trillion: Alphabet \$195 to 205B this year with "significant further increase" next; Microsoft \$255 to 260B for its fiscal 2027; Amazon about \$220B; Meta \$135 to 145B. Google Cloud backlog is \$514B, AWS backlog \$496B. Nvidia's own supply commitments doubled to \$279B in a single quarter. This is a multi-year order book, which is what makes buy-and-hold viable in a sector that is usually traded.

Why toll collectors over cyclical. Every dollar of that capex passes through a small number of chokepoints: Nvidia and Broadcom design the silicon, TSMC builds essentially all of it, and the memory and equipment makers supply the inputs. The chokepoints have pricing power through the cycle. The inputs do not. Micron's 85% gross margin and \$100B of contracted memory revenue are extraordinary, and memory has never once held an extraordinary margin through a full cycle. AMD is held directly at 7%; memory and equipment makers are not held at all, which is deliberate for names whose earnings can halve in a downturn.

NAME	LATEST QUARTER	GUIDE / OUTLOOK	FWD P/E*
NVDA	Rev \$96.2B (+106%), DC \$89.0B (+117%), GM 75%	Q3 \$108B; supply for 70% growth in FY28, demand higher	~25x
TSM	Q2 \$40.2B, GM 67.7%; Aug rev +53% y/y	2026 growth "slightly above 40%"; capex \$60 to 64B	~20x
AVGO	Rev \$29.6B (+86%); AI semi \$16.7B (+221%)	Q4 AI semi \$21.7B; FY27 \$115B, FY28 \$230B	~19 to 24x
AMZN	Net sales \$200.6B (+20%); AWS \$42.2B (+37%), backlog \$496B	2026 capex ~\$220B; capacity constrained into 2027-28	n/a
MSFT	Azure +43%, >\$100B run-rate	Azure ~45% next qtr; FY27 capex \$255 to 260B	~25x
AMD	Rev \$11.5B (+50%); data center \$6.7B (+107%)	Q3 guide \$13.0B (+41%)	n/a

*Forward P/E figures are approximate and vary by data provider; treat as a range.

What would break the thesis

- **Capex cuts.** Two or more of the top hyperscalers guiding capital spending down year over year. This is the kill switch (section 7). Slower growth in capex is not a trigger; an actual decline is.
- **Policy.** Section 232 chip tariffs (25% on a narrow set since January; "phase two" on servers and devices being drafted), the China remote-access loophole, and the CAC telling Alibaba and ByteDance not to buy Nvidia parts. Nvidia's guidance already assumes zero China data-center revenue, which is the right way to hold it.
- **Rates.** A 10-year above 5% is the first serious valuation competitor these stocks have faced in the AI era.
- **An industry-led slowdown** of the kind the September 12 essays proposed. Watch whether it shows up in orders, not in op-eds.

6. Engine two: the GLP-1 / obesity pipeline (36%)

Size and growth. GLP-1 class sales were about \$132 billion in 2025, up 33%, and tirzepatide became the best-selling drug in the world. Forecasts for 2030 range from \$114B (Goldman, obesity only) to \$200B (J.P. Morgan, all incretins). Lilly alone guides to \$85 to 87B of total revenue this year after growing 48% last quarter. In July, weekly US prescriptions for the two oral drugs were about 206,000 combined, a form factor that did not exist twelve months ago.

Why a leader and a laggard. Lilly is winning: Zepbound beat CagriSema head to head, Foundayo is the first oral small-molecule GLP-1, and retatrutide delivered up to 30% weight loss in Phase 3, a number no competitor has matched. It earns the 18% weight. Novo is losing, and the stock is priced as if it will keep losing forever: down 69% from the 2024 high, 12x trailing earnings. Yet its oral Wegovy took 90% of the US oral market in its first six months, it has six Phase 3 amycretin trials running, and it has a \$1.3B cost programme finishing this year. An 8% position is a bet that "losing to Lilly" and "shrinking" are different things.

Why the pipeline names. The next wave is about dosing and delivery, not just efficacy: monthly injections (Amgen's MariTide, Pfizer's berobenatide) and once-daily pills (Structure's aleniglipron, Viking's oral VK2735, AstraZeneca's elecoglipron). Big pharma has paid over \$50 billion for obesity assets since 2025, so the one small cap here, Structure, is also a takeover candidate. It is sized at 2% so a failed trial costs the portfolio 2% and a buyout adds meaningfully; Viking is the natural second if you ever want one. Pfizer and West Pharmaceutical were dropped from an earlier draft: at this account size their weight does more work in Lilly. Roche's enicepatide is excluded because its US ticker is OTC-only.

ASSET (HOLDER)	MECHANISM · DOSING	STAGE · REGISTRY	KEY NUMBER	NEXT CATALYST
Retatrutide (LLY)	GLP-1/GIP/glucagon, weekly	Phase 3 complete; TRIUMPH-1 NCT05929066	Up to 30.3% weight loss at 80 wk	Head-to-head vs tirzepatide, Nov 2026; filing
Foundayo (LLY)	Oral small-molecule GLP-1, daily	Approved Apr 1, 2026	34k weekly Rx (July), \$149/mo self-pay	EASD data Oct 1; script ramp
Wegovy pill (NVO)	Oral semaglutide, daily	Approved Dec 2025	~172k weekly Rx, ~90% of orals	EU rollout Sept 2026; EASD Sept 28 to Oct 2
Amycretin (NVO)	GLP-1/amylin, weekly SC and oral	Phase 3 AMAZE 1 to 8; NCT07339423	~22 to 24% at 36 wk (early)	Readouts 2028 to 2029
MariTide (AMGN)	GLP-1 agonist / GIP antagonist antibody, monthly+	Phase 3 MARITIME-1/2; NCT06858839	~20% at 52 wk (Ph2)	Topline 1H 2027
VK2735 (Viking, not held)	GLP-1/GIP, weekly SC and oral	Phase 3 VANQUISH-1/2; NCT07104500	Oral: 12.2% at 13 wk (Ph2)	Maintenance data Q3 2026; oral Ph3 start Q4
Aleniglipron (GPCR)	Oral small-molecule GLP-1, daily	Phase 3 ACCOMPLISH-1/2; NCT07654361	~16% placebo-adj. at 44 wk (Ph2b)	Data ~2028; runway through 2028

What would break the thesis

- **Price.** The November 2025 most-favored-nation deal put Medicare and Medicaid at \$245 a month and TrumpRx at \$299 to \$449 versus a \$1,086 list. Lilly's Q2 already cited lower realized Zepbound prices. Volume is winning the race with price so far; a further 40%+ cut to US net pricing is the kill switch.
- **Generics abroad.** Semaglutide exclusivity lapsed in Canada in January and China in March; US, EU and Japan are protected. A Novo problem more than a Lilly one, and already in the NVO price.
- **Safety and trial failure.** The FDA removed suicidality warnings this year and no class-wide signal exists; a class-wide label change would be the trigger. Single-trial failure is real, and is why GPCR is capped at 6% and never added to.

7. Engine three: power and grid (15%), and the rules

Why power and grid instead of gold and energy. Hyperscaler capex of \$725 to 765 billion this year buys chips that have to be plugged in. Interconnection queues run years, gas-turbine order books are sold out into the next decade, and the existing nuclear fleet, the only large source of firm carbon-free power, is being contracted to data centers on 20-year terms. His portfolio owns the chips and the clouds and none of the electricity. Vertiv is the rack-level power and cooling; GE Vernova is the turbines and grid gear; Constellation is the nuclear megawatts. This sleeve is correlated with AI on the way up, which is the point of a race, and it has a second driver, grid replacement and electrification, that continues if AI capex pauses.

Caution on entry. GE Vernova and Constellation were not researched at current prices in this pass, and both ran very hard through 2025 and 2026. Look at a one-year chart before buying. If either looks parabolic, park its \$25 half in Vertiv and half in SGOV and revisit at the next quarterly check.

Rule 1 · Check quarterly, act rarely

Look at the account once a quarter (mid-January, April, July, October, after the big earnings weeks). Fifteen minutes. If nothing below is triggered, close the app.

Rule 2 · Per-position bands

Every core name has an add-first level at half its target and a trim level at twice it (table in section 2). Above the trim level, sell back to 1.5x target; cash goes to SGOV until it is 5%, then to the name furthest below target. Legacy and speculative names are never added to and are trimmed if they double. SGOV is refilled to 5% whenever it falls under 3%.

Rule 3 · The one sleeve check

If NVDA, TSM, AMD, AVGO, MSFT and AMZN together exceed 55% of the account, trim the largest of them until the group is 50%. The chip names rise together, and each can sit just under its own cap while the book is two-thirds chips. This is the only sleeve arithmetic in the plan, and the workbook computes it.

Rule 4 · New money

Every new deposit goes to the core name with the lowest weight divided by target. Never to a legacy or speculative name. This is what converges the portfolio to target without ever selling.

Kill switch A · AI sleeve

Trigger: two or more of the top five hyperscalers guide capex down year over year, or Nvidia data-center revenue declines for two consecutive quarters. Action: cut the AI group to 25% (AMD and AMZN first, then pro rata) and halve the power sleeve, selling VRT and GEV before CEG since nuclear contracts run for decades; move proceeds to VOO and SGOV half and half. Slower growth is not a trigger. A stock price drop is not a trigger.

Kill switch B · GLP-1 sleeve

Trigger: US branded GLP-1 net pricing cut more than 40% by legislation or negotiation, or a class-wide safety label change. Action: cut the GLP-1 group to 20%; keep LLY and AMGN, exit GPCR, HIMS and WST, halve NVO; proceeds to VOO and SGOV.

Kill switch C · Macro

Trigger: fed funds above 5% (two hikes beyond the current 2027 median). Action: raise SGOV to 15% by trimming the overweight sleeve pro rata. Reverse when the Fed cuts twice.

Position failure

If GPCR halves on a trial failure, do nothing. The position is too small to matter and the rule is never to add. If it is acquired, the cash goes to the GLP-1 sleeve at target weights. If a regulator blocks data-center co-location deals with nuclear plants, halve CEG into SGOV.

Quarterly checklist

1. Type today's position values into the workbook's Quarterly check tab. 2. Any row says TRIM? Sell to the "back to" level, cash to SGOV first. 3. AI group above 55%? Trim the largest. 4. Did a kill-switch trigger actually occur (a guide, a filing, a label), not a headline? 5. Close the app. A band should fire about once a year; a kill switch rarely, possibly never.

8. Sources and data notes

Research was gathered September 16, 2026. The sandbox could not load full pages, so most figures come from search-engine excerpts of the pages below and should be treated as approximate until checked against the primary release. Prices are September 15 closes unless noted. A fuller, itemized source list with every URL is in the companion file research-notes.md.
